Introduction

• Study of inhomogeneous plane waves
• Seek to tune the incident wave parameters to maximize energy transmission into dissipative solids

Exemplary Lossless Fluid—Solid Interface: Magnitude of Reflection Coefficient

(adapted from Woods et al., 2015)
Introduction

- Potential applications for enhanced acoustic energy transmission into solid materials:
  - Nondestructive structural testing
  - Medical ultrasound imaging and ablation
  - Other, non-contact ultrasound applications
Plane Wave Representation in Dissipative Media

Attenuation vector, \( \vec{A} \)

Propagation vector, \( \vec{P} \)

\[ \gamma (\text{inhomogeneity}) \] also affects \( \vec{P} \) and \( \vec{A} \) according to the material wavenumber condition \( \vec{K} \cdot \vec{K} = k^2 \)

Wavevector components:

\[ \tilde{k}_x = |\vec{P}| \sin(\theta) - j|\vec{A}| \sin(\theta - \gamma) \]
\[ \tilde{k}_z = |\vec{P}| \cos(\theta) - j|\vec{A}| \cos(\theta - \gamma) \]

Degree of inhomogeneity, \( 0^\circ \leq \gamma < 90^\circ \)

Complex wavevector, \( \vec{K} = \vec{P} - j\vec{A} \)
Dissipative Fluid–Solid Interface

- Semi-infinite fluid—solid interface, linear viscoelastic model (hysteretic damping)
- Boundary conditions at interface \( z = 0 \)
  \[
  \tilde{\sigma}_{zz}(x, 0) = \tilde{\sigma}'_{zz}(x, 0) \\
  \tilde{u}_z(x, 0) = \tilde{u}'_z(x, 0) \\
  \tilde{\sigma}'_{xz}(x, 0) = 0
  \]
- Trace wavenumber continuity
  \[
  \tilde{k}_{L,x} = \tilde{k}'_{L,x} = \tilde{k}'_{S,x}
  \]

Water—Stainless Steel Interface

Magnitude of Reflection Coefficient (10 MHz)

Effect of Wave Inhomogeneity and Incidence Angle

Effect of Wave Inhomogeneity ($\theta_L \approx 30.83^\circ$)

Minimum value at $\gamma_L \approx 88.85^\circ$
Transmitted Energy Flux

Incident wave amplitude set as 1 Pa at $x = z = 0$

Normal Intensity in Solid

$$I_z = \frac{1}{T} \int_0^T -\left( \sigma_{zz} v_z + \sigma_{xz} v_x \right) \, dt$$

Transmitted Normal Intensity

(at the point $x = z = 0$)

Transmitted Normal Intensity Distributions (mW/m$^3$)

Degree of Inhomogeneity, $\gamma_L$

Homogeneous incident wave

Inhomogeneous incident wave
Transmitted Energy Flux

Incident wave amplitude set as 1 Pa at \( x = z = 0 \)

Normal Intensity in Solid

\[
I_z = \frac{1}{T} \int_0^T - (\sigma_{zz} v_z + \sigma_{xz} v_x) \, dt
\]

Transmitted Normal Intensity
(at the point \( x = z = 0 \))

Homogeneous incident wave

Inhomogeneous incident wave
Transmitted Energy Flux

Incident wave amplitude set as 1 Pa at $x = z = 0$

Normal Intensity in Solid

$$I_z = \frac{1}{T} \int_0^T - (\sigma_{zz} v_z + \sigma_{xz} v_x) \, dt$$

Transmitted Normal Intensity
(at the point $x = z = 0$)

$|\vec{R}|$

Degree of Inhomogeneity, $\gamma_L$

Transmitted Normal Intensity Distributions (mW/m$^3$)

Homogeneous incident wave

Effect of Increasing Material Dissipation

Magnitude of Reflection Coefficient vs. Dissipation Level (10 MHz)
Effect of Increasing Material Dissipation

Magnitude of Reflection Coefficient vs. Dissipation Level (10 MHz)
Effect of Increasing Material Dissipation

Magnitude of Reflection Coefficient vs. Dissipation Level (10 MHz)
Conclusions and Future Work

• Inhomogeneous plane waves incident at dissipative fluid–solid interfaces
  • Significant energy transmission increases for low-loss solids
  • No improvement for higher-loss solids
• Future work:
  • Incorporate frequency-dependence of attenuation
  • Use of bounded wave profiles
  • Generation through phased arrays of sources

Plane Wave Representation in Dissipative Media

• Helmholtz equation requires consistency of complex wavevector \( \tilde{K} = \tilde{P} - j\tilde{A} \) with material wavenumber condition:

\[
\tilde{K} \cdot \tilde{K} = \tilde{k}^2 = \left( \frac{\omega}{\nu_H} - j\alpha_H \right)^2
\]

• It follows that \( \gamma \) (inhomogeneity) affects \(|\tilde{P}|\) and \(|\tilde{A}|\):

  • Inhomogeneous waves (\( \gamma \neq 0^\circ \)):

\[
|\tilde{P}|^2 = \frac{1}{2} \left( \text{Re}[\tilde{k}^2] + \sqrt{\left(\text{Re}[\tilde{k}^2]\right)^2 + \left(\frac{\text{Im}[\tilde{k}^2]}{\cos^2(\gamma)}\right)^2} \right) > \left( \frac{\omega}{\nu_H} \right)^2,
\]

\[
|\tilde{A}|^2 = \frac{1}{2} \left( -\text{Re}[\tilde{k}^2] + \sqrt{\left(\text{Re}[\tilde{k}^2]\right)^2 + \left(\frac{\text{Im}[\tilde{k}^2]}{\cos^2(\gamma)}\right)^2} \right) > (\alpha_H)^2
\]
Approximation for Critical Dissipation Level

- Assumed negligible losses in fluid, small losses in solid

\[ \alpha'_S^* \approx \frac{1}{4} \left( \frac{\rho v_L}{\rho' v'_S} \right) \left( \frac{v'_R y}{\sqrt{v'_R y^2 - v_L^2}} \right) \frac{\omega}{V} \]
