Standards Column — Toward an Open Discovery Ecosystem

by Todd Carpenter (Managing Director, NISO, One North Charles Street, Suite 1905, Baltimore, MD 21201; Phone: 301-654-2512; Fax: 410-685-5278) <tcarpenter@niso.org> www.niso.org

One of the challenges of buying complex digital content products or services is that it is often difficult to know in advance everything that is included with the product. To be fair, this was often the case in complex analog products as well. However, it seems more problematic with electronic products — perhaps because there is no “under the hood” that most of us can access easily.

The rapid explosion in digitization efforts and the reduction in costs of digital storage has made it possible to store the entire text of collections as large as the one held by the Library of Congress in something that could easily fit on your desktop. The problem from a user’s perspective is knowing exactly what is included when dealing with content at that scale. This is most certainly the case with the next generation of indexed library search services that have come to the market over the past few years. Each vendor has to work out a relationship with each publisher that covers what and how much of that provider’s content is included in the index and crawled regularly for updates. For a variety of competitive reasons, few organizations are willing or able to discuss what is included in their index. This problem is not limited to subscribed index services, but also exists for large search engines, such as Google, Google Scholar, Bing and Yahoo!. The “secret sauce” of each index, namely what is included, is considered a trade secret, and subscribing libraries don’t have the specifics of what they are getting.

Not that long ago, no librarian would have purchased a product where they didn’t know what was included or abstracted. How could a librarian know or trust what was included and whether that content met the library’s acquisition criteria, patron needs or expectations? A&I providers routinely provided detailed information criteria, patron needs or expectations? A&I providers routinely provided detailed description of indexing performed for each item or collection of content and the level of availability of the content.

NISO issued a call for participation in the ODI project and response was overwhelmingly positive, giving some indication of the importance the community sees in this work. The working group formed in January is chaired by Marshall Breeding (Vanderbilt University) and Jenny Walker (Ex Libris) and consists of representatives of libraries, publishers, content aggregators and distributors, and discovery-service providers.

Related to this project, NFAIS recently released a draft Code of Practice for Discovery Services for public comment on February 1. The draft code addresses some of the business practice and policy questions related to discovery services. Among the topics covered are: contractual rights and obligations of the parties, inclusion of content, identification of content ownership, description of ranking basis, content included in the index, description of service components, and authentication. NISO and NFAIS have historically worked closely together, and this draft code of practice is being reviewed by the NISO ODI group. It is expected the NFAIS and forthcoming NISO recommendations will be complementary rather than overlapping or contradictory.

Another related project is the JISC-funded Project was launched in May 2011 to “create a ‘metadata ecology’ that will support better access to vital collections data in libraries, archives and museums and facilitate new services” within the UK. The project is focused primarily on the availability of core metadata for search and discovery based on principles of open and available metadata. While it is not specifically focused on the discovery services per se, building consistent metadata structures for cultural content contributes to strength of discovery services.

Providing understandable and usable access to digital materials is a critical service that requires the engagement of all members of our community. From the efficient distribution of quality metadata from publishers, to the unbiased presentation of search results, to the appropriate use and measurement of these services, a great deal of coordination is required. This is where organizations like NFAIS and NISO can best serve the community — by fostering community consensus about the underlying business practices and technology.

Back Talk from page 70

As I thought back on the perhaps hundreds of interviews I participated in over the past 40 or so years to fill jobs in the libraries where I have worked, I fondly remembered the times when the interviewee and their resume turned out to be the same person. But I also found that often the applicant and the resume had little in common because she or he was simply so nervous that they couldn’t communicate clearly. At times I sensed that hidden in some of the people who failed the interview process were individuals who could have made a great contribution to my library but who could not sell themselves sufficiently well to gain the support of their direct supervisors or potential colleagues. Instead, someone else got the job because they had a greater gift of gab. Clearly, for me, I can see how all of the work needed to get interviews and to prepare for interviews is worth the considerable time and energy required. I would be happy to go into further detail with those looking for a job or to put them in contact with a free center like the one at which I serve, but located nearer to where they live. Email me at <anthony.ferguson185@gmail.com>. In any event, good luck with your job search.
