How Special Are Special Collections?

Column Editor: Bob Holley (Professor, Library & Information Science Program, Wayne State University, Detroit, MI 48202; Phone: 248-547-0306; Fax: 313-577-7563) <aa3805@wayne.edu>

S

should libraries shift their attention to special collections and pay less attention to commercially published books? Rick Anderson at the University of Utah has suggested doing so in his piece, “Can’t Buy Us Love: The Declining Importance of Library Books and the Rising Importance of Special Collections.” The document is available as a free download at: http://www.sr.ithaka.org/blog-individual/can't-buy-us-love-rick-anderson-kicks-new-ithaka-sr-issue-briefs-series. I discovered this provocative document through a column by Joseph Esposito, “For Libraries the Future Is a Foreign Country,” in The Scholarly Kitchen. http://scholarlykitchen.sspnet.org/2013/08/07/for-libraries-the-future-is-a-foreign-country. I presented a counterview for some institutions that led to an exchange of comments between Anderson and me that I would like to expand here.

To give the conclusion first, Anderson and I agreed that this new collection development model depends upon the larger institution’s goals and should not undermine the academic mission of the university. I see, however, internal funding issues and outside political forces that may pose obstacles to any such shift. I also wish that he would have defined special collections more precisely.

To give a bit of history first, I made heavy use of special collections in my early academic career as a doctoral student in French Language and Literature at Yale University (1967-1971). The course I took on the 18th-century French novel required visiting Yale’s Beinecke Library to read a particularly rare text. My best term paper was an analysis of how Montaigne cited Lucretius that required access to the very early edition that Montaigne quoted. Similarly, my dissertation on French dialogues des morts required tracking down obscure resources at Yale and elsewhere. I appreciate the value of special collections in advancing scholarship.

Rick Anderson’s thesis is that libraries should shift resources from collecting and providing access to commodity documents (traditionally published books) to the non-commodity materials found in special collections. He proposes acquiring these materials, digitizing them, and making them findable not only by traditional cataloging but through metadata accessible “to popular search engines.” By doing so, scholars will have access to additional scholarly resources beyond those that can be easily acquired commercially. I wish to make it clear that he is not advocating abandoning collecting commodity documents, though he recognizes that any shift will result in the purchase of fewer traditional materials. I also recognize that this short summary does not do justice to his reasoning and suggest reading the full document.

My first concern is the definition of special collections. After reading the document multiple times, I’m not sure whether he includes archival materials or not. While many examples are printed materials, his closing illustration deals with “handwritten diaries produced by 19th-century pioneers who came west on the Overland Trail.” I would consider these to be archival materials since they were never published in multiple copies. On the other side, I would consider some materials currently held in research library special collections to be as much commodity documents as currently published works since they are readily available though expensive enough to require special protection. They can be as easily replaced as a current best seller; it just takes a lot more money to do so. Some materials in special collections are also museum pieces to be acquired for their beauty and special features such as ornate bindings without much value for scholarship. I am going to base my discussion here on a definition of special collections as follows: unique or inaccessible materials of potential scholarly interest including archival materials.

My interpretation of Anderson’s document is that he proposes moving funds from the monograph acquisitions budget. I question whether this is possible in some research libraries. Databases, serial subscriptions, and big deals have taken an increasing percentage of many research library budgets to the point that not much is left for book purchases. What is purchased is now often through patron-driven acquisitions with very little material bought that won’t see immediate use. In my own institution, Wayne State University, I have had very little funding after meeting faculty direct needs and covering eBook purchases through PDA. Any diversion of these funds to special collections would penalize meeting current needs.

The other possibility would be to reduce the purchase of non-monograph digital resources. If costs continue to rise, this may happen anyway. Doing so would most likely lead to canceling some databases and packages that faculty and students would miss much more than the non-purchase of monographs. These cuts would most likely lead to the reduction in access for STEM (Science, Technology, Engineering, Medicine) researchers, who in some ways have been unaffected by the cuts in monographs since many STEM disciplines depend more on journals.

I would greatly fear the political consequences in any publicly-funded research institution from the diversion of funding from STEM research resources to special collections. My governor wants public higher education to provide jobs for students and to produce research that will benefit the Michigan economy. I believe that many university presidents want to continue to support their STEM research initiatives during a period of danger from cuts in the federal budget. In addition, the advantage of making non-commodity scholarly materials available to outside researchers can turn into an internal political disadvantage if doing so means not meeting recognized local needs in areas that bring research funding to the university.

To quote my comments in The Scholarly Kitchen exchange: “My situation would then be the need to cut resources in STEM areas since not much is left to cut in the Humanities and the Social Sciences. I would hate to defend the library if a well-funded researcher with multiple grants complained to the state legislature that an important resource in his/her area was cut to protect funding for transcribing Overland Trail narratives. Furthermore, this researcher quotes the Dean of Libraries who said that he/she should write to colleagues to get copies of the needed articles rather than finding them in a few seconds in the resource that was just cut. The Dean of Libraries also said that funding scholarship was more important than meeting local needs for commodity publications. (This is a misquote, but I would make it if I were the researcher.)” To explain part of the quote above, Anderson suggests that researchers could request copies of articles directly from the authors by email for items not found in the local collection.

Among many possibilities, I will comment on three additional issues. The first is that the Anderson initiative continued on page 32
Another Look at Browzine

by Angela R. Flenner (Digital Services Librarian, Addlestone Library, College of Charleston) <FlennerA@cofc.edu>

Browzine is an app that delivers e-journal content to your iPad or Android tablet. The app itself is free, but in order to access the journals your library subscribes to, your institution must purchase an annual subscription.

The move to electronic journals has benefits over print journals but also costs. Browzine aims to replicate some of the experience of hard copy journals (such as the serendipitous browsing experience) while taking advantage of some of the benefits of c-journals. The reading experience is an improvement over reading in a browser on your computer screen, especially if you plan to read the whole article. It's an even greater improvement over reading in in-browser on an iPad, which, depending on the vendor, is sometimes impossible to scroll past the first page.

Often the best option is to download the PDF of the article and read it in iBooks, but it can be difficult to keep these files organized. The file names are usually an incomprehensible string of letters and numbers, so you have to open each file to find a specific title. Browzine improves this situation by organizing your Save Articles by journal and renaming the file with the title of the article. An additional improvement might be the ability to search one's own reading list by author or title.

The biggest issue with Browzine is that it does not deliver content from all of our subscribed journals. In our feedback from faculty, this was the only complaint we heard. One part of that is that Third Iron's technical team needs to configure access to each publisher individually, so they are gradually adding publishers each month. The longer-term issue is that they can't provide access to journals that we subscribe to only through aggregators. From what I understand, this is because they can't handle the ever-changing coverage data and embargoes.

Some librarians were critical that Browzine isn't available on a desktop or laptop computer. Third Iron didn't rule it out as a future development, but they did say it wasn't high on their priorities. In their view, there are many ways to view articles from your desk. I could see the benefit of a Web app that lets you add articles to your Browzine library for reading later. Third Iron did say that they plan to develop apps for smart phones in the future.

After our trial in the spring of 2013, we were impressed by the usability and organization of the app. We had some reservations about subscribing, though. Primarily this was because the journals Browzine provides access to were heavily weighted towards the sciences and particularly medical science. Our institution is primarily liberal arts, and we were a little disappointed with the coverage of the humanities. Soon after our trial, however, Third Iron added access to several more publishers, including over 200 journals from Project MUSE. The coverage is still fuller in the science and technology fields — in our instance, the app covers 904 journals in Biological Sciences, 1,563 journals in Biomedical and Health Sciences, but only 249 journals in Arts and Humanities and 144 in History. Partly this is because more journals exist in the natural science and technology fields, but the coverage of our humanities journals is still smaller, percentage-wise.

Despite the limitations I've discussed, we still decided to subscribe. Several of us in the library have started checking it regularly, using it like Zite or Feedly but for scholarly journals. We plan to spend some time this fall reaching out to the faculty to make sure they know what it is and how to use it. During the trial, we got some very positive feedback from those that used it, but we think that it can get more use, especially as the list of included journals grows.
