WisDOT Case Examples Using SPMs

January 27, 2016
Agency Factoids – WisDOT

122 Signals
99% w/ communication
2 engineers
4 electricians

94 Signals
16% w/ communication
2 engineers
4 electricians

115 Signals
29% w/ communication
2 engineers
4 electricians

160 Signals
79% w/ communication
4 engineers
6 electricians

453 Signals
23% w/ communication
9 engineers
8 electricians

Approximately 950 signals statewide with communication to 400 of the signals.
~ 50% fiber & 50% cellular
Agency Factoids – Systems

- Deployed UDOT Signal Performance Metrics
  - ~170 intersections collecting high resolution data*
Agency Factoids – Detection & PreEmption

- Stop Bar Detection (left turns and side street)
  - 6’ x 20’ typical
- Dilemma zone detection on the mainline and high speed side streets
  - Regional variances in layout/design
- Loop, Video and Microwave all used
  - Regional Preference
- Use Lane Group Detection
  - Considering shift to Lane by Lane for performance measures
- Loops typically numbered such that first digit indicates phase it is associated with
- Detection failures are identified by our travelling public
- EVP is installed upon request (approx. 30% currently)
- Railroad Preemption at approximately 24 state owned signals
WisDOT Experience

- Nov 2014 – IT project approved
- May 2015 - Test intersections were added
- July 2015 – Test intersections communicating with system and additional intersections (ASC3s with fiber) added
WisDOT Next Steps

• Add EPAC intersections on fiber to SPM system
• Create alarms/reports
• Figure out how to get data via cellular modems
• Work with our IT staff on storage space issues
• Make sense of adaptive system performance metrics
• Continue to add remote detection to the remaining signals
• Develop operations based performance measures
