Final Report

DEVELOPMENT OF A METHOD FOR ESTABLISHING RESURFACING PRIORITIES FOR THE PAVEMENT MANAGEMENT SYSTEM IN INDIANA

TO: H.L. Michael, Director
Joint Highway Research Project

July 3, 1984
Revised May, 1985

FROM: K.C. Sinha, Research Engineer
Joint Highway Research Project

Project: C-36-63I
File: 9-7-9

Attached is the Final Report on the HPR Part II Study entitled, "Development of a Method for Establishing Maintenance Priorities for the Pavement Management System in Indiana." The research was conducted by Mr. Benjamin Colucci-Rios under the direction of Professors K.C. Sinha and E.J. Yoder.

The report here documents the data used, the procedures followed, the models developed, and model results. Recommendations for incorporating the study findings in the IDOH Pavement Management System are also included. It should be noted that the study findings have already been presented to the members of the IDOH Pavement Management Task Force by Mr. Colucci and Professor Sinha in a workshop held on May 7, 1984.

The report contains three volumes; Vol I provides an executive summary, Vol II presents the study procedures and results, and Vol III includes the appendices.

This report is forwarded for review, comment and acceptance by the IDOH and FHWA as fulfillment of the objectives of the research.

Respectfully submitted,

K.C. Sinha
Research Engineer

ACKNOWLEDGMENTS

Several individuals provided much assistance to the study. In particular, the help of Messrs. Paul Owens, Keith Kercher, Barry Partridge, Sedat Gulen and Tom Stevens of the IDOH, Mr. James Threlkeld of the FHWA and Dr. Virgil Anderson of Purdue University is gratefully acknowledge. Special thanks are extended to Ms. Ann Russell and Dr. Essam Sharaf for their assistance in the preparation of computer programs.

INTRODUCTION

This report presents the appendices to the report, "Development of a Method for Establishing Resurfacing Priorities for the Pavement Management System in Indiana, Vol. II: Study Procedures and Results." There are five appendices. In Appendix A, are presented the location of test sections used for the computation of Pavement Condition Indices in the Crawfordsville District of the IDOH. Appendix B presents the predicted roughness numbers for the Interstate system. Appendix C lists the equations for the Roughness Reduction Model formulation under Budget Scenario 2. Appendix D presents the complete results of the Contract Section Worth and Roughness Reduction Models under five alternate budget scenarios. In Appendix E is presented the listing of the computer program used to prepare the necessary data for input to the optimization program.

* Indicates roughness number and year the pavement section was selected as input to the model.

+ Means outer lane.

Appendix E
Listing of Computer Program

Description of Preoptimization Computer Program

A computer program called "Preopt.f" has been written in FORTRAN to be used prior to the optimization program. The purpose of this computer program is to get the data pertaining to the pavement sections identified as deficient and arrange them in a suitable manner to be used by the optimization program. These data include:

- roughness number
- increase in roughness number
- pavement condition
- pavement age
- directional ADT
- accumulated ADT
- traffic growth

Other parameters input to the program include:

- pavement resurfacing cost
- routine maintenance cost
- different resurfacing activities
- budget estimates for each calendar year

Relative weights for each performance factor are also input to the program to compute the objective function coefficients.

The equivalent performance curves described in Chapter 3 are input to the program in nine data statements one for each performance curve. Different performance curves have been developed for asphalt, concrete pavements, and continuously reinforced concrete pavements.

The pavement contract section is the unit of measurement used as input to the program. Northbound and southbound lanes as well as east and westbound lanes were considered as different pavement contract sections.

In the preparation of the input file for the program it is recommended to enter first those contract sections which are known to be in greatest need of major rehabilitation for example, 1982 deficient pavement sections should be input first, then 1983 sections and so on.

The program, in its present form, is formulated for a five year analysis period.
