JOINT HIGHWAY RESEARCH PROJECT
PURDUE UNIVERSITY AND
INDIANA STATE HIGHWAY COMMISSION

TRAFFIC SPEED REPORT NO. 90

TO: J. F. McLaughlin, Director
Joint Highway Research Project

FROM: H. L. Michael, Associate Director
Joint Highway Research Project

June 13, 1973

File: 8-3-3

Project: C-36-10C

The Attached Progress Report No. 90 on Traffic Speeds is the report of the 1972 study of free-flowing automobile and truck speeds on rural, tangent, level sections of Interstate, 4-lane and 2-lane highways in Indiana. The report has been prepared by Mr. W. K. Law, a Graduate Instructor in Research on our staff, under the direction of Professor H. L. Michael. The data were collected by Messrs. G. K. Stafford and W. B. Luttrell of our staff.

The results indicate an increase of 0.33 mph in the average speed of all passenger cars and an increase of 0.79 mph for heavy trucks to that of the 1971 study. A simple linear regression analysis over the last eleven years (1962-72) indicated that there has been an increasing trend in speed for most classifications of vehicles and highways of between 0.5 and 1.0 mph per year. Speed values for the past few years, however, indicate that the increasing trend is less today than it was five or six years ago.

Copies of this report are requested for release to the Indiana State Police, the Indiana Traffic Safety Council and the Indiana Office of Traffic Safety as a normal procedure for these reports. Copies will also be sent to the Federal Highway Administration and several departments within the ISHC. The report is presented for the record and for release as noted.

Respectfully submitted,

Harold L. Michael

ABSTRACT

This report is the annual continuing study of speeds of vehicles on rural Indiana Highways. Observations of spot speeds were taken on Interstate, four-lane, and two-lane highways throughout the state during the months of June, July and August 1972.

Analysis of the speeds showed the overall average speed for passenger cars was 65.20 miles per hour. The overall average speed for heavy trucks was 57.56 miles per hour. This was 0.33 mph more for passenger cars and 0.79 mph more for trucks than similar data given for 1971 at the same locations (except for station 10 which had been shifted 0.8 mile northward).

Simple linear regression analysis shows an overall 0.75 mph increase of speed for all classification of vehicles and highways over the last 11 years. This trend is a bit less than that of a ten year period ending five or six years ago and appears to result from a "leveling-off" of maximum speeds in recent years.

TRAFFIC SPEED REPORT NO. 90

This report is an analysis of spot speed observations made during June, July and August 1972. All observations were made of free-flowing vehicles on level, tangent sections of rural highways during daylight and under favorable conditions. The same locations on selected Federal and State highways as used in 1971 were used again except for Station 10, which has been moved 0.8 miles northward to as equivalent a site as possible to the original site. All other locations except station 9 have been the same for many years. Stations were classified as two-lane, four-lane, or interstate highways. A representative sample of spot speeds was obtained at each of the four stations in each classification. The site locations were as follows: (See Figure A)

Interstate Highways

1. I-69	3.3 miles south of Junction SR 18
2. I-65	1.0 mile west of Junction SR 334
3. I-74	1.0 mile east of Junction of Post Road
4. I-65	7.5 miles north of Junction of SR 160

Four Lane Highways

5. U.S. 31	1.2 miles south of Junction of SR 38
6. U.S. 52	1.0 mile east of Junction of SR 28
7. U.S. 41	1.0 mile north of South Junction of SR 2
8. U.S. 52	1.0 mile west of Klondike

Two Lane Highways

9. U.S. 35	1.5 miles east of Junction of I-69
10. S.R. 43	1.2 miles south of Chalmers
11. U.S. 31	3.0 miles south of Rochester
12. S.R. 25	0.7 miles west of Americus

FIG. A - LOCATIONS OF SPEED-STUDY STATIONS

The vehicles were classified as Indiana or Non-Indiana Passenger Cars and Light (less than 5000 lbs. gross weight) or Heavy (equal to or more than 5000 lbs gross weight) Trucks. The analysis was performed as classified and combined, passenger cars or trucks.

The maximum speed limits in Indiana are as follows: 70 mph on interstate highways and 65 mph on other rural highways unless otherwise posted. The state limits were applicable at all stations of this study except for Station 11 which had been posted at a 60 mph limit. This lower speed limit appeared to have little effect on the traffic speeds (See Table 11).

Equipment and Field Procedure

The observations for this study were obtained by use of an "Electromatic" Rada Speed Meter. The meter was placed approximately four feet from the edge of the pavement at angles less than 10° with the highway center line. No corrections of speeds were necessary at these small angles. At the beginning of the study the accuracy of the meter was checked and any constant discrepancy of readings was corrected accordingly.

Results of Analysis

The data collected were analyzed and summarized in Table 1 to 12 in the Appendix. Tables 13, 14 and 15 summarize the data for interstate, four lane, two lane highways respectively. Table 16 is the summary for all highways.

The average speed for each classification of vehicles on each type of highway for this study was as follows:

	<u>Interstate</u>	<u>Four Lane</u>	<u>Two Lane</u>
<u>Passenger Cars:</u>			
Indiana	69.11	64.31	61.97
Non-Indiana	69.55	64.32	62.41
85 Percentile (all)	74.37	70.94	68.69
<u>Trucks</u>			
Less than 5000 lbs.	63.67	59.37	58.25
5000 lbs or more	60.93	55.19	55.62

The percent of vehicles exceeding the speed limit for each classification of vehicles and each type of highway was as follows:

	<u>Interstate</u>	<u>Four Lane</u>	<u>Two Lane</u>
<u>Passenger Cars:</u>			
Indiana	41.96	45.50	29.47
Non-Indiana	43.22	48.47	32.17
<u>Trucks</u>			
Less than 5000 lbs.	13.64	23.08	14.12
5000 lbs or more	3.95	4.26	4.55

The percent of vehicles traveling 5 mph or more above the speed limit for each case was as follows:

	<u>Interstate</u>	<u>Four Lane</u>	<u>Two Lane</u>
<u>Passenger Cars:</u>			
Indiana	13.78	18.20	11.10
Non-Indiana	12.71	20.25	7.83
<u>Trucks:</u>			
Less than 5000 lbs.	3.03	10.26	3.39
5000 lbs or more	0.00	0.43	0.41

The results of this study and similar studies conducted since 1962 are tabulated in Table A. A simple linear regression analysis on these results was conducted and a summary is given in Table B.

A linear relationship between speed and year was assumed with β the estimated slope of the straight line. Four hypotheses were tested ($\beta = 0.5$, $\beta = 0.75$, $\beta = 1.0$ and $\beta = 1.5$) in order to place values on annual trends. It was found that an increase of a 0.75 mph/year trend existed for all cases at the 95% confidence level.

A graphical representation of Table A and B is given in Figure B.

FIG. B - INDIANA RURAL SPEED TRENDS

Summary and Conclusions

The average speeds in this study were found to be 0.33 mph higher for passenger cars and 0.79 mph higher for heavy trucks than the results of 1971.

The simple linear regression on the results of the past eleven years (1962-1972) concluded at 95% confidence level that:

1. There has been a 0.75 mph/year average annual speed increase for the following nine classifications:
 - a. Interstate Passenger Cars 85-percentile,
 - b. 4-lane Passenger Cars 85-percentile,
 - c. 2-lane Passenger Cars 85-percentile,
 - d. Mean of all passenger cars,
 - e. Mean of all light trucks,
 - f. Mean of all heavy trucks,
 - g. Interstate Heavy Trucks 15-percentiles,
 - h. 4-lane Heavy Trucks 15-percentiles,
 - i. 2-lane Heavy Trucks 15-percentiles.
2. The speeds of the past 5 years indicate that the increases during this period have leveled off compared with the period 1961-1967.

The increase in mileage of high type highways such as the interstate system and the growing percentage of vehicles violating current maximum speed limits tend to support the belief that drivers select the travel speeds they consider safe irrespective of the maximum speed limits.

Determination of Sample Size

It was desired that a 95% confidence interval of the true mean of the speed of passenger cars should not be wider than 2mph. For trucks weighing 5,000 lbs. or more a 95% confidence interval with a 4 mph band was desired.

Assuming a normal distribution of speeds and using the standard deviation of the 1971 data, the minimum sample size requirements were determined by:

For Passenger Cars:

$$N = \left[\frac{2 \times 1.96 \times 7.49}{2} \right]^2 = 216 \text{ observations}$$

For Heavy Trucks:

$$N = \left[\frac{2 \times 1.96 \times 6.64}{4} \right]^2 = 42 \text{ observations}$$

NOTE:

At all stations, at least 330 passenger car observations and 46 heavy truck observations were obtained for the study reported herein.
