TRAFFIC SPEED REPORT NO. 115

TO: H. L. Michael, Director
Joint Highway Research Project

FROM: R. M. Shanteau, Research Associate
Joint Highway Research Project

February 2, 1982
File: 8-3-3
Project: C-36-10C

The attached Progress Report No. 115 is the report of the July-September 1981 study of free flow automobile and truck speeds on tangent, level and dry sections of rural interstate, 4-lane and 2-lane highways and on urban interstate highways in Indiana. The report has been prepared by Mr. A. J. van Wijk, Graduate Instructor in Research on our staff, with assistance from Ms. P. J. Tirschman, drafting assistant on our staff. The data were collected by Mr. G. K. Stafford of our staff. All phases of the study were directed by Professor R. M. Shanteau, Research Associate on our staff.

The overall results show an average free flow speed of 56.9 mph, up only 0.3 mph from 1980. In fact, speeds have not changed much since the implementation of the 55 mph speed limit in 1974.

This report includes a chart, Figure 2 on page 8, that graphically summarizes the results of summer free flow speed monitoring since 1970. Such charts have not been included in the Traffic Speed Reports since the summer study was combined with the study for compliance with the National Maximum Speed Limit in 1975. This chart shows that speeds of all classes of vehicles on all types of highways have not changed much since 1974. Generally speaking, the 55 mph speed limit caused the 85th percentile passenger car speeds to drop by about 7 mph, while the 15th percentile speeds remained unchanged.

Copies of this report will be sent to the Federal Highway Administration and the Indiana DOH. Copies of this report are requested for release to the Indiana State Police and other highway safety agencies, as is normal procedure for these reports.

Respectfully submitted,

Robert M. Shanteau

Robert M. Shanteau
Research Associate

TRAFFIC SPEED REPORT NO.

This report is an analysis of spot speed observations made during the summer months, viz. June, July, August and September, of 1981 in Indiana. All observations were made of free-flowing vehicles on level, tangent sections of rural and urban highways under favorable conditions. All the observations were made during daylight.

This is the first report with exclusively summer observations since 1975. From 1976 until 1980 (Traffic Speed Reports Nos. 95 through 114) 14 primary and secondary stations as well as another 14 randomly selected stations were monitored every quarter.

A total of 14 speed monitoring stations were used for the study reported herein. These stations are divided into four categories, including four rural interstate locations, four rural four-lane locations, four rural two-lane locations and two urban interstate locations. These 14 locations are the same as the primary and secondary control stations monitored since 1975 in Indiana. Prior to 1975 only the twelve rural stations were monitored. The locations of the 12 rural stations are essentially the same since 1970 except for stations 4L-32 (old number 6 on US 52) and 2L-54 (old number 11 on US 31), which changed in 1975.

The speed limit at all the stations is 55 mph.

The site locations are given in Table 1 and shown in Figure 1.

The vehicles were classified as Indiana or Non-Indiana Passenger Cars and light (less than 5000 lbs. gross weight) or heavy (equal to or more than 5000 lbs. gross weight) trucks. Analysis was performed for each vehicle classification and for combined passenger cars or trucks.

Sample Size

A minimum of 200 vehicles in each direction were recorded using the free flow technique at each station. At least 25 of these vehicles were required to be heavy trucks (in each direction).

Equipment and Field Procedure

The observations for this study were obtained by use of a Radar Speed Meter. The meter was located in a van type vehicle parked as a disabled vehicle on the right shoulder or as a normally parked vehicle in an access driveway to the road. The van was equipped with one-way vision windows on the rear and side facing traffic so that approaching vehicles could not observe the speed measurement process. The observers were also equipped with CB radio equipment so as to

monitor possible radio notification of the speed measurement and of police vehicles in the area. When any such incidents occurred speeds were not taken for at least 15 minutes. This problem primarily occurs on interstates.

The speed was measured at a distance from the van so that the angle of measurement with the highway center line was always less than 10°. No corrections of speed were necessary at these small angles. The accuracy of the meter was checked at the beginning of each data recording session, every time the sampling technique was changed, and at other times when deemed necessary.

Results of Analysis

The data collected were analyzed and are summarized in the Appendix. Tables A1 through A14 include the data for the free flow data on each individual station. Tables A15 through A18 summarize the free flow data by highway classification. Table A19 is the summary for all highways.

The results of the free flow data expressed by highway classification and vehicle type are as follows:

The results of this study and similar studies conducted since 1970 are tabulated in Table 6. The speeds given in the table up to 1974 were obtained from Traffic Speed Report No. 92. The speed values for 1975 to 1978 were calculated from the tables given in the respective appendices of the reports (nos. 94, 98, 102, 106) for the 14 locations used in this study. The 15th and 85th percentile speed values were calculated by interpolation over 5 mph speed intervals. The same values for 1979, 1980 and 1981 were calculated by interpolation over 1 mph speed intervals in the raw data.

Figure 2 represents a graphical presentation of the results from this and similar studies since 1970. The speed values plotted in Figure 2 were obtained in the same way as those in Table 6, except for the values from 1970 to 1974, which were obtained from a similar graph in the Traffic Speed Report No. 92. This was done to be consistent with the annual traffic speed reports up to 1974. Only data collected at the 12 rural stations were used to calculate the values given in Figure 2.

Table 7 displays the average speeds for all passenger cars, trucks of more than 5000 lbs. as well as trucks less than 5000 lbs. with and without the two urban interstate stations. The urban interstates were first monitored in 1975.

Table 7. Average Speeds (mph)

Year	Passenger Cars		Trucks Less Than 5000 lbs.		Trucks 5000 lbs. or More	
	12 Rural Stations	All 14 Stations	12 Rural Stations	All 14 Stations	12 Rural Stations	All 14 Stations
1975	58.5	58.7	57.2	57.4	57.8	57.5
1976	57.5	57.6	56.3	56.4	56.4	56.6
1977	58.2	58.2	57.7	57.8	57.0	57.1
1978	58.2	58.2	57.9	57.8	56.6	56.6
1979	57.1	61.8	57.2	57.0	56.0	56.1
1980	56.7	56.8	56.8	56.6	56.0	56.1
1981	57.0	57.1	56.7	56.6	56.1	56.3

CONCLUSIONS

The average speed of passenger cars on all types of highways in 1981 increased 0.4 mph from 1980. The largest increase was on 4-lane and 2-lane highways with increases of 0.6 mph each. The average speed of light trucks (trucks less than 5000 lbs.) increased only 0.2 mph. The largest increase occurred on the 4-lane highways with an increase of 1.0 mph. This was followed by an increase of 0.6 mph on urban interstates. The average speed for the heavy trucks (5000 lbs. or more) remained the same since 1980. The largest increase, 0.8 mph, occurred on the urban interstates and the largest decrease, 0.3 mph, on 4-lane highways (Tables A15-19). These changes are very small.

The very small changes are also illustrated by Figure 2. The mean speeds of cars, light and heavy trucks on rural highways remained virtually the same since 1979. The mean speeds dropped sharply from the summer of 1973 to the summer of 1974. They increased a little in 1975 and remained fairly

constant until 1978, except for a slight drop in 1976. A slight drop in mean speeds occurred in 1979 and they have remained almost constant since then.

Since the average speeds are in most cases almost the same for the 12 rural highway stations and the 12 rural highway and 2 urban interstate stations combined (Table 7), there is no reason to expect the results to change if the urban interstate stations are included in the analysis.

The 85th percentile speed of cars on all rural highways decreased sharply between 1973 and 1974. They increased a little in 1975, but remained fairly constant until 1978, except for an increase of 1.5 mph in the 85th percentile speed of cars on rural interstates in 1977. The 85th percentile speed remained the same on the rural interstates from 1979 to 1981. For the other rural highways it showed a slight reduction in 1980 (Figure 2).

The 15th percentile speeds of heavy trucks on rural highways showed no marked change since 1974. The 15th percentile speed of heavy trucks on rural interstates is basically the same as in 1970. The 15th percentile speed of heavy trucks on the other rural highways increased a little. There seems to be a slight downward trend in the 15th percentile speed of heavy trucks on rural highways from 1978 to 1981 (Figure 2).

The difference in 85th percentile of passenger cars and the 15th percentile of heavy trucks on all rural highways was reduced sharply from 1973 to 1974. Since then it remained fairly constant until 1981, with the smallest and most constant differences during 1978 to 1981.

The average speeds of vehicles on all highways seem to have remained essentially the same since 1979. The difference in 85th percentile speeds of passenger cars and 15th percentile speeds of heavy trucks remained almost the same since 1978 on all rural highways and is much less than what it was before 1973.
