by **Katina Strauch** (Editor, *Against the Grain*) <kstrauch@comcast.net>

ATG: Moshe, tell us about JoVE, the *Journal of Visualized Experiments*. We understand that it is a video journal for biological research.

MP: JoVE has created a new video-based concept of scholarly publishing. In this concept, a scientific journal article has two principle components, video and text. The video provides a step-by-step demonstration of research procedures and methods employed. Since “a picture is worth a thousand words,” such video-articles enable more efficient knowledge transfer than traditional text-only articles, allowing much faster learning for end users, scientists, and students.

Despite its innovative format, JoVE acts as a rigorous scientific journal, having a prestigious Editorial Board, employing review processes, and being indexed in **PubMed** and **MEDLINE**. To summarize, JoVE is the first-in-the-world video journal for biological and biomedical sciences.

In the end, JoVE aims to make a revolution in science and STM publishing industry to convert publication into a productivity tool that can be used to rapidly transfer new knowledge and technologies. This will save a lot of time and money for scientists, educators, and their institutions.

ATG: What led you to create this format? What sort of acceptance/take up have you been experiencing? What is the current subscription price for a year?

MP: I came to this idea because of my personal experience as a research student in biology, during my Ph.D. studies at **Princeton**. For laboratory scientists, it is very, very difficult to learn new experimental methods and technologies based on their description in traditional text-based science journals. This is because the text format cannot provide an adequate description of numerous details important for accomplishing a particular experiment. So scientists spend a lot of their time (months) and grant money “reinventing the wheel,” when they have to re-learn experi-

ments already done and described by others. The practical solution to this problem typically employed in labs is to find another scientist who is familiar with specific methods employed and who can **show** how to apply them. But often such a help is not available, and scientists are forced to repeat the experiment again and again until it begins to work. This is a well known “bottleneck” problem of productivity in biological sciences, and every practicing biological researcher is aware of it.

Doing my Ph.D. thesis research and suffering from this problem, I asked myself a question: “What will be a systematic solution for this problem?”. I realized that an ideal solution would be to mimic the “show me” solution and produce videos demonstrating every possible biological experiment. I also realized this solution should be presented as a journal, and not just a database or Website, to provide scientists with an incentive to participate in this project. This is because academic scientists care mostly about two things, grant money and their publications in scientific journals — “publish or perish,” as we know this academic phenomenon. If so, video would become a science article of a new type. So the idea of JoVE was born.

I co-founded JoVE with my two partners, **Nikita Bernstein** and **Klaus Korak**. **Nikita** is the company CTO, and he did all the Web development to build the JoVE Website. **Klaus** was the first investor and he recruited further investments to finance the company operations. I should mention other people, JoVE employees, who strongly contributed to the company growth at first stages: **Aaron Kolski**, **Andreaco**, **Nandita Singh**, **Mark Shalinsky**, and others.

ATG: Tell us more about the current production of the journal.

MP: The video-production presented a significant challenge we had to overcome. As JoVE was started, we realized it is very difficult to make a video on biological experiment. It requires special equipment, software, skills for filming and editing that scientists typically do not have. Therefore scientists cannot produce good videos on their own experiments. This means that JoVE has to produce these videos for them in their labs. For this purpose, we established an international network of filming professionals, selected and trained to film videos in laboratories at scientific institutions around the world. This network

now covers 12 countries including USA, Canada, UK, Germany, Sweden, Switzerland, Israel, and Australia. To maintain the current publication rate, we produce 40 videos per month. We worked hard to make this process manageable and cost-effective, yet it should be noted that the production costs per article are much higher for JoVE than for traditional text-only publishers since we have to pay the fees for video filming and editing.

ATG: What sort of acceptance have you been experiencing? What is your subscription price?

MP: Since its foundation in the end of 2006, JoVE has published over 750 video-articles describing research methodologies in different areas of biological sciences such as neuroscience, developmental biology, microbiology, immunology, stem cells, bioengineering, and others. Most of these articles are produced at leading academic institutions in the USA and Europe such as **Harvard**, **MIT**, **Yale**, **Stanford**, **Yale**, **NIH**, **Berkeley**, **Oxford** (UK), **Cambridge** (UK), **Max Planck Institute** (Germany), **Weizmann Institute** (Israel), and others.

With respect to the subscription pricing structure, we divide institutions to three tiers: Ph.D. level (first tier), M.Sc. level (second tier), and B.Sc. level (third tier). The Ph.D. level institutions include universities granting Ph.D. degrees and research institutes. Colleges are typically included in the B.Sc. level tier. In 2009-2010, the subscription price for Ph.D. level institutions was \$2,400 per year.

This year, receiving numerous requests from scientists and students, we have increased our publication rate and established two new sections, JoVE Neuroscience and JoVE Immunology & Infection. We offer these new sections for subscription in 2011, so for Ph.D. level institutions the total price for the three-section package is \$7,200, if subscribed before January 1, 2011. The price will be higher after this date, as we try to attract early adopters to subscribe as soon as possible so we can use the funds to further increase our publication rate.

continued on page 50

Our prices are significantly lower for M.Sc. and B.Sc. level institutions.

Currently, nearly 200 institutions are subscribed to JoVE, including such world leaders in research and education as **Harvard, MIT, NIH, Stanford, Yale, UC Berkeley, Princeton**, and others. Overall, the list of subscribers includes research universities, colleges, and pharma companies.

ATG: *Do you have peer reviewers? How does the peer-reviewing process work with a video journal?*

MP: The JoVE peer review is very similar to the peer-review process in traditional text journals. A video article is sent to three anonymous reviewers who then provide their comments on the video and text part of each article. For example, they can say “I have a problem with this specific procedure at 3 minute 5 second from the beginning of the video.”

ATG: *How is this financed? Did you obtain a grant? How will JoVE be supported in the future?*

MP: After its foundation in the end of 2006, JoVE was financed through an “angel” investment received from a group of private investors in Switzerland, Germany, and Austria. As its operations grew, JoVE has implemented a business model, which is very similar to the models employed by other STM publishers. The revenues come from author fees, institutional subscriptions, and sponsorships from companies. JoVE became profitable at the end of 2009, and continues to grow.

The main difference between JoVE and other STM publishers is the high cost of video production which makes JoVE articles much more expensive to produce. We have to carefully walk the thin line between keeping our operations sustainable and keeping our subscription fees acceptable to institutions, especially in these difficult library budget times.

ATG: *We notice that you have “sponsored articles.” What does that mean? Are these peer reviewed?*

MP: Sponsored articles means articles where video-production fees are sponsored by biotech companies, producers of research tools. They are peer reviewed too, of course. A disclaimer on sponsorship is included for such articles.

ATG: *How is JoVE indexed or made available in the wider Internet community? Is it indexed by ISI or will it be considered for indexing there?*

MP: JoVE is indexed in **MEDLINE/PubMed** and **Chemical Abstracts/Scifinder**. We are considering an application to **ISI**.

ATG: *This is an innovative and “next generation” publication. What other similar types of endeavors are you aware of?*

MP: I do not want to sound arrogant but I did not hear about any other significant recent

Moshe Pritsker

BORN AND LIVED: Born in Russia, immigrated to Israel at age 16, came to U.S. as a Ph.D. student at age 26. For those who don't know, “Moshe” is the Hebrew version of “Moses.”

EARLY LIFE: I was born in the city named Petrozavodsk, which is the North-West part of the Soviet Union. I had a normal life of a normal Soviet school child. In 1990, at the age 16, I immigrated to Israel together with my parents, in the big wave of Russian-Jewish immigration. I went to study chemistry at the Hebrew University of Jerusalem, and then continued for a master degree at the Weizmann Institute of Science. After the army service mandatory for every Israeli citizen, I decided to see the world and got into the Ph.D. program at Princeton, NJ.

PROFESSIONAL CAREER AND ACTIVITIES: I got a Ph.D. in Molecular Biology from **Princeton University** and a M.Sc. in Chemistry from the **Weizmann Institute of Science**. I worked in a few research areas such as stem cells, genomics, bioinformatics, and HIV. The results of my research were published in well-known scientific journals (*PNAS, JBC, Genome Research and Biochemistry*). For one year, I was working as a post-doctoral researcher at the **Massachusetts General Hospital**, affiliated with **Harvard Medical School**. Then I started JoVE.

FAMILY: Single.

IN MY SPARE TIME I LIKE TO: Read, watch movies.

FAVORITE BOOKS: Many. The last I read – *Predictable Irrationality* by **Dan Ariely**.

PHILOSOPHY: Work hard, life is short.

MOST MEMORABLE CAREER ACHIEVEMENT: First article published in a scientific journal (*PNAS*) and the indexing of JoVE in **PubMed**

GOAL I HOPE TO ACHIEVE FIVE YEARS FROM NOW: Grow JoVE big, make it even more useful.

HOW/WHERE DO I SEE THE INDUSTRY IN FIVE YEARS:

I think the STM publishing industry will mainly remain the same because I do not envision any viable alternatives to its current business model or any significant changes in the workflows/incentives governing the behavior of end users, scientists, and students. Significant changes, if they happen, will be generated by technological developments such as the spread of mobile devices, quality product improvements (e.g., video), or changes in the economics of science and education. 🍌

developments with respect to the format of scientific articles. In general, with respect to the principal format, the STM publishing did not change much since the publication of the first scientific articles in the 17th century. Yes, science literature content was transferred to the Internet, but the nature of the articles remains the same — these are poorly structured text descriptions that are full of technical terms, understandable only to specialists in specific narrow fields, and difficult to use even for these specialists. At this moment, we see some first attempts by STM publishers to experiment with changes in the traditional text-based format. For example, the journal *Cell* (published by Elsevier) works on the project called “Ar-

ticle of the Future” to integrate more visual information in its articles. But such attempts are still very rare.

So far, the important changes happened in the way we organize and use the scientific literature. Creation of **PubMed** by the **National Library of Medicine (NLM)** was a true revolution, in my opinion. **NLM** continues to lead integrating **PubMed** with **Genbank** and other resources changing usage patterns and creating totally new experiences for scientists and students. Linking and cross-referencing was very helpful, too. The “author-pay” business model promoted by the Open Access movement was an interesting development. However, again, these

Don't wait for the grapevine when you can find out ONLINE.

PROGRAM UPDATES

Your selection profiles can now be created and customized by LC Class Number on our updated web site.

KEEP YOURSELF INFORMED OF NEW TITLE RELEASES EACH MONTH WITH OUR ONLINE NEW TITLE SELECTION PLAN.

Want to get new title information even faster? Now you can.

At Emery-Pratt, our number one job is to make your life easier. So we're offering the "New Title Selection Plan" an online program that will let you see the newest book releases 1 to 6 months in advance, right from the convenience of your computer. Your Selection profiles can be easily created and customized for complete flexibility on our web site at www.emery-pratt.com by publisher, author, BISAC subject code, or LC Class Number. These selection profiles can be added, edited, or deleted by you at any time. Best of all, when you see a book you want, you can order it immediately online for fast turnaround.

Finding the latest book at the best price is what we do.

No more researching to find out what's new. Just keep an eye on your e-mail and rest assured that you'll be notified as soon as a new book is available.

Interview — Moshe Pritsker from page 50

changes did not affect the principal structure and format of the scientific article, and this is where JoVE wants to make a difference.

A number of new initiatives were made in the scientific community information space. For example, there were a few attempts to create science-oriented Facebook-like social network sites (e.g., **Epernicus.com** and **Labmeeting.com**) and YouTube-like community video sites (e.g., **SciVee.tv** and **DNAtube.com**). We are yet to see how much these initiatives will be adopted by the scientific community.

From my experience, to be adopted, any new offering in science communication has to align with current professional incentives of scientists and students: getting grants, publishing in scientific journals, finding the next job, or receiving better grades. Otherwise, it will not work.

ATG: Please speculate on the future for the journal.

MP: I am optimistic since the JoVE receives more and more acceptance among scientists, students, and librarians. We will expand by increasing the scope and rate of the video publication. Specifically, we plan to establish new JoVE sections for major areas of biomedical research such as Oncology and Bioengineering, in addition to Neuroscience and Immunology that are being built now. We should consider expanding to other areas such as Psychology.

I think that sooner or later, following the JoVE growth, big STM publishers will try to massively integrate online video into their products, although it will require significant technology developments and organizational changes on their part. From this point of view, JoVE serves as a pioneer and a catalyst of change for the entire industry. In the end, video will become an important component of the STM publishing. 🌱

Against the Grain / December 2010 - January 2011

Rumors from page 43

enhanced reading. We will see sentences from many different articles brought together." This is the power of the computer technology. Still, the artifact must remain for future generations.

http://www.katina.info/conference/video_2010_trust.php

Which brings me to the word "stewardship." I only took note of two Plenary speakers using that word during the **30th Charleston Conference**. The first was **Brian Schottlaender** who made stewardship the centerpiece of his talk – Full Spectrum Stewardship of the Scholarly Record. And the second was **Jon Orwant** from Google Books. **Stewardship** (and not just patron-driven materials) must come back into our vocabulary. <http://www.slideshare.net/CharlestonConference/full-spectrum-stewardship-of-the-scholarly-record-by-brian-e-c-schottlaender-university-of-california-san-diego>

Speaking of which – did you hear **Jon Orwant's** (Engineering Manager, Google Books) talk at the **30th Charleston Conference** this past year? It was Friday afternoon late and it was fascinating! The auditoriums were packed even though it was 5:30 to 6:15 on Friday! **Jon** says that he estimates that you can read 7,000 books in your lifetime. That's a lot of **Kindle** and **Nook** and **iPad** purchases!

http://www.katina.info/conference/video_2010_orwant.php

Welcome to the circumspect **Alex Holzman** (did you see him in Charleston?) who is the new editor of the **University Press** column in **ATG**! Bringing up words and all, I was interested in the column in this issue, p.61, by **Richard Brown** which talks about the need for librarian/university press collaboration, **REAL collaboration**. **Brown** points to the use of casual metaphors (e.g., university press as dinosaur, printed books as relics). He urges that we be more careful with our language. Books/Words are more than bits and bytes. They are expressions of an author's/writer's/groups' thoughts.
