to become masters of the variables involved in making scholarly content available. Not only are the models increasing, but the variables reflected in those models are multiplying, too. Just think of the variables that a lending or demand-driven model adds to your eBook calculations.”

At many university presses, a book's life will begin with a profit & loss estimate, designed to calculate the costs of editing, typesetting, permissions, printing, and electronic conversion and distribution/storage, among others. However, these formulas only work when estimated sales for the book's various formats are entered into the spreadsheet. And there's the rub. Sales forecasting pre-recession was a tricky and largely imperfect art, so after the crash of 2008 and the advent of eBooks — which in turn led to our current splintering of sales and income models, rent vs. own, subscription vs. perpetual access, etc. — putting realistic numbers into that spreadsheet in 2013 can seem alternately like an exercise in futility or eerily remind one of advice typically given by SAT test preparation coaches: “Think about the information you do know, and then carefully make your very best guess about the answer to this question.”

This exercise in sales forecasting is far more than a theoretical concern. Certainly, a press needs to know how many of a book it should plan to sell (and plan to print, taking into account that the print number should be lowered by the amount of projected sales that will be for electronic rather than print copies) to determine if the book is a financially-viable project. Increasingly, though, as presses' budgets are being examined, a publisher also needs to know what their cash flow will look like in a given year. Traditionally, patterns of library buying and the prevalence of approval plans gave forecasters a rough idea of an ideal print run, since the bulk of library sales occurred in the first two years of a book's life. In the same way libraries, too, could budget for what they projected to spend on monographs and subscriptions. But the many new sales models, particularly for electronic content and in plans involving PDA or STL, money is earned (or in the case of the libraries, spent) according to use. Use may be the new metric that will ultimately determine cost, but that cost, according to Saunders, “needs to be metered in a way that doesn't bankrupt libraries or publishers.” How do presses guess at — let alone budget for — the actual use of their books, taking into account the fact that the income earned by a particular title may now trickle in over a series of many years rather than primarily at the beginning of its life? Similarly, how can libraries accurately predict their own costs in this on-demand approach to content access? See the previous advice of the test-prep coach.

So there it is. We all make our best guess. We have to guess at how many books we can sell (short term, long term, in whole or in part) and price the books and the access

against the grain people profile

Dean Sanderson

BORN AND LIVED: Born in Ohio; Lived in Virginia, Michigan, Germany; Currently live in Connecticut.

PROFESSIONAL CAREER AND ACTIVITIES: 1987-97: Magazine publisher at **Gruner+Jahr** in Hamburg and New York (*Parents Magazine*, *Ser Padres*, *YM*). 1998-2008: Managed German subsidiary and then all international businesses of **Scientific American, Inc.** 2008-2011: Managed advertising and sponsorship sales at **Nature Publishing Group**. February 2011-now: Manage site license, advertising, and sponsorship sales teams at **NPG**.

FAMILY: Wife, three boys, two bunnies.

IN MY SPARE TIME: Raising three boys; reading; riding my bike; drawing.

FAVORITE BOOKS: *The Rings of Saturn*, **W.G. Sebald**; *Lolita*, **Nabakov**; anything by Tolstoy.

PET PEEVES: Pretentiousness in all its forms.

PHILOSOPHY: Work hard, be fair, and things will generally work out OK.

MOST MEMORABLE CAREER ACHIEVEMENT: At **Scientific American**, people remember me most for my juggling act at the 2007 Christmas party. But I'm probably most proud of the work I did running a small but complex consumer science publishing company in Germany. Managing a business during a profound market change is never easy, but doing it in a different language and culture was an added challenge.

GOAL I HOPE TO ACHIEVE FIVE YEARS FROM NOW: To have done five years of good work for **NPG**.

HOW/WHERE I SEE THE INDUSTRY IN FIVE YEARS: I wouldn't mind knowing where it will be in five months! At **NPG**, we're constantly debating the question of where scientific communication is moving and how we need to evolve to move with it. Much of our focus in recent years has been on building open access options for scientists who want to publish that way — the Gold OA option at **Nature Communications** has been very successful, for example, and *Scientific Reports* is building momentum quickly — and more will be coming. My personal view, however, is that we're likely going to be living in a “multi-channel” world for a long time to come: open access publishing will continue to grow rapidly, but subscription-based publishing will still survive and flourish for many titles. 🌱

plans according to numbers that we believe will get us to a break-even status (if you're a non-profit university press). We make these guesses knowing that we may not make the numbers and knowing that we'll be participating in a number of sales and access models so that we can gather some actual data about what seems to be working for the vendors, the libraries, and the patrons they serve. We make guesses knowing that we will be selling fewer copies of our books due to increased consortial activity, textbook rental programs (both print and electronic), and campus-wide electronic access to titles that would have previously sold vigorously as course adoption titles. We make guesses based on the knowledge that unlike scholarly print books, which carry smaller discounts since they travel to more specialized markets, eBooks are considered all the same (in terms of discount) by the vendors. As a result, presses give up significant revenue on this format, a matter of increasing concern as eBook sales and licensing to libraries increase and print sales continue to decrease.

This is one explanation for why there are so many sales models and so many different pricing and access options out there today. I don't believe publishers are deliberately trying to add to the confusion, and indeed we likely suffer from it as much as anyone else in the chain of scholarly communication. We experiment because we want to give our customers what they want according to their needs. We also experiment in order to build a set of data that will help us determine which models work most successfully and sustainably for us as publishers.

Several of the people I talked with indicated that these issues were also hallmarks of the uncomfortable transition that occurred in journals a decade ago (round we go?), so there are likely lessons that can be drawn from those experiences. They also had interesting thoughts about how the book landscape may change and evolve over the next few years, and I'll explore those ideas further in the next issue. 🌱
