Books Do Furnish a Room

by **Ann Okerson** (Advisor on Electronic Resources Strategy, Center for Research Libraries) <aokerson@gmail.com>

"Books do furnish a room" was the nickname of an **Anthony Powell** character named Lindsay Bagshaw and provided the title for one of the novels of **Powell's** *A Dance to the Music of Time*. Many of us would agree with that lovely sentiment, and there are great universities who take the maxim seriously. For example, **Princeton** has had a student center rotunda filled with donated books — one distinguished scholar contributed his set of the flagship journal of a learned society of which he had been president. Georgetown houses rarely summoned old periodicals in a gorgeous space used mainly for formal university events.

But there are those, including **Rebecca Shuman** in a recent article in *Slate*, who would make that sentiment an axiom of library design. There must be books, she argues, not just so people can read them, but because books induce a reflective and contemplative spirit not otherwise easily achieved. The Linonia and Brothers Room in **Sterling Library** at **Yale** has proved that for many decades now, offering a choice collection of important books and great old green overstuffed chairs and sofas, whose springs, as you sit on them, still resonate with the brilliant minds and gentle snores of earlier Yalies who studied and reposed there. For all that, the space is not nearly as heavily used as spaces with library computers or spaces that have comfortable and well-wired seating areas, with most-heavily used books and study materials in proximity.

The fact is that a collection of codex books is both a beautiful and useful thing. What books should be in such a collection and how

they should best be, as we say nowadays, "discoverable," are important questions that librarians everywhere are addressing. But it is also true that not every book a library owns needs to be in a traditional open-stack collection. Librarians know that better than anyone, and we have been building off-site repositories for decades now. These repositories work amazingly well. They are less beautiful and inspiring than most reading rooms or vast echoing corridors of open stack shelving at the heart of a campus, no question, but they often prove as or more useful and effective, to say nothing of more economical, than adding lots of those echoing corridors of open stack shelving that fewer users much visit these days or foregoing other necessary spaces.

Making decisions about what remains within arm's reach and what waits obediently for an automated system to retrieve it in 24 hours more or less is a serious business. Librarians' good professional judgment, good communication, and immense respect for faculty and student concerns all play a part. Mistakes can get made, no question, and they should be promptly fixed.

Blurred generalities, on the other hand, help no one. In the case of the recent *Slate* article, the complaint was raised about moving 40%

of a small college's collection offsite — i.e., about 170,000 volumes. That college's library has access for its students and faculty to the full collections of two other peer colleges within 50 miles and to millions of volumes in all of the state's libraries, available for rapid delivery by courier. Gaining access to these millions of items might well be more valuable to the

college's community than putting 170,000 lower-use items off campus. The library also provides access to countless numbers of information resources (journals, books, data, government publications, videos, and so on) in electronic and other formats.

On the basis of much evidence, this college is being very well served indeed by its library; and where there's controversy over what is undoubtedly a complex decision, it's a matter for that community to thrash out, not for less-informed outsiders to make the object of soap-boxing. The *Slate* article engages in hyperbole and emotion, with far too little understanding of what makes a library a library nor of the tough space trade-offs that need to be made today at our colleges and universities. 🍀

A Case for the Use of Collection Analysis Tools in Deselection

by **Cris Ferguson** (Director of Technical Services, 222 Waterfield Library, Murray State University, Murray, KY 42071; Phone: 270-809-5607) <cferguson13@murraystate.edu>

A library considers a myriad of factors when undertaking a monographic deselection project. The need for space, institutional priorities, and the obsolescence of materials all play a role in determining what and how much to remove from the collection. Whether items are being withdrawn or simply stored in an off-site facility, the criteria factoring into the decision as to whether to keep a particular item could include circulation and in-library use data; reviews and authoritative title lists; availability of the title in eBook archives like the **HathiTrust**; how widely (or scarcely) the title is held at other libraries; and the availability of the item through interlibrary loan or possibly a shared print archive.

Given that much of this information is freely available, it is not surprising many

libraries opt to gather the data for deselection projects on their own, pulling circulation data from their OPACs, searching WorldCat for holdings in other libraries, examining reviews, and investigating online availability for titles under consideration for weeding. However, compiling data from these disparate sources into a single interface and generating functional reports requires a significant investment of time and manpower. I would argue that this manual investigation is often inadequate and the cost in terms of the staff time required is simply too high.

A rules-based approach to weeding utilizing a collection analysis tool offers a practical alternative to this time consuming investigation and title-by-title analysis. Collection analysis tools bring together several

data points under one umbrella, streamlining the data gathering and simplifying the analysis process, providing tangible benefits for a library. Establishing rules-based weeding criteria alleviates the subjectivity of the collection analysis and speeds up the deselection process. Overall, this approach is more time efficient, expedites overlap and gap analysis within the collection, and facilitates batch processing both of records and materials.

Some examples of collection analysis tools available, both commercial and open source, include **OCLC's** WorldShare Collection Evaluation (formerly known as WorldCat Collection Analysis), **Sustainable Collection Services**, **Bowker's** Book Analysis System, **Intota** Assessment, **GIST**

Gift and Deselection Manager, INN-Reach Union Catalog, and **ProQuest** Title Matching Fast. While these systems vary in their services and functionality, each is designed to help librarians assess their holdings for both collection development and deselection purposes.¹

It is important to note that, as a profession, we are collectively responsible for archiving materials and preserving access to information, but, with improved print resource sharing and online availability, it is not necessary that every library retain a copy of every book. To ensure that libraries are not all weeding the same titles and that content is archived both in print and electronically, it is necessary to compare our holdings with other libraries and repositories and to analyze where there are overlaps or gaps in our collections. We must have some knowledge of what is held by peer institutions, what may be available in shared print archives, and what is available electronically, before we can decide what we can remove from our own collections.

While we can certainly export our holdings and the accompanying circulation statistics from our catalogs, the work involved in aggregating our own data with data from other libraries, WorldCat, or the **HathiTrust** is not insignificant, requiring batch processes for both retrieval and matching.² In a 2014 article in the *Journal of Library Administration*, **George Machovec** points out that, while manual comparison of title lists is certainly possible, it requires the expense of substantial effort and time.³ **Machovec** goes on to say, "Except for projects that are small in scope, it is worthwhile investigating commercial and open source tools for monographic and serial overlap and gap analysis."⁴ Collection analysis tools are specifically designed to help libraries

navigate this type of large-scale analysis by normalizing data, matching data points, and producing institution-level reports.

One of the challenges libraries face in the deselection process is establishing objective measures for making reasonable and unbiased decisions. A rules-based approach to deselection used in conjunction with a collection analysis tool can streamline the decision-making process. When using a rules-based approach to deselection, libraries "define categories of books that could be withdrawn without title-by-title review, enabling a batch approach to some weeding decisions."⁵ Establishing and adhering to clearly defined rules for what should be weeded and what should be kept, it reduces, if not eliminates, time consuming title-by-title analysis.

In anticipation of a new library as well as the implementation of an automated storage and retrieval system, **Grand Valley State University (GVSU)** undertook a weeding project in 2009. Working with **Sustainable Collection Services (SCS)**, **GVSU** established a set of criteria and used those to generate lists of potential weeding candidates. **Julie Garrison**, Associate Dean of Research and Instructional Services at **GVSU**, cited the ability to look at their collections through many lenses and quickly identifying things that were widely held, but hadn't been circulated, as two of the benefits of using **SCS**. "With this project, the assumption was that if a book was a withdrawal candidate then it should be withdrawn unless there was a reason to keep the book. The library had used this method in the past on smaller weeding projects and found it increased the yield and seemed to reduce librarian anxiety."⁶

Removing more than 30,000 books over the course of a few summer months, **GVSU** made several important decisions that helped streamline their project: librarians were required to provide a rationale for every

book that was retained, and physical review was not performed for every item that was withdrawn. By basing their weeding decisions around data and pre-defined rules, **GVSU** was able to save time and improve consistency in their deselection.

Libraries strive to make the most effective use of their spaces, and, as part of that effort, it is of the utmost importance to make educated, unbiased, and timely decisions about our collections. Use of a collection analysis tool in conjunction with a rules-based approach to weeding offers libraries an alternative to manual data gathering and title-by-title analysis. Collection analysis tools can expedite overlap and gap analysis, facilitate batch processing of both records and materials, and ultimately speed up the deselection process. Libraries embarking on a large-scale deselection project would be well-served by a collection analysis tool and the implementation of a rules-based decision-making process. 🌱

Endnotes

1. For more information on individual products and the services they provide, I would suggest **George Machovec's** 2014 article in the *Journal of Library Administration*. Cited below, **Machovec's** article provides information regarding the services provided by several of the products mentioned in this article, as well as some comments on the strengths and weaknesses of each.

Collection Management Matters from page 12

especially when they turn a deaf ear or try to convince you that they are giving such a grand bargain that it is unwise for you to consider breaking up the package. Databases are bundled because some of them do not sell well by themselves and the usage statistics will separate the wheat from the chaff, while shining a spotlight on what is essential.

If there is a contract in place for the database, you will more than likely have to be a

wallflower until it expires or weigh the consequences of making changes. In the meantime, start preparing the faculty for the news that the database may disappear next year, so that they can plan their lessons accordingly. This time can also be used to put alternative measures in place. When we had to give up a very expensive STEM database, we discovered that we had a deposit account, probably initiated by our former dean long ago with a now defunct consortia, that allowed us to order articles from a deposit account.

Planning ahead and evaluating each renewal will keep you gliding along in the

database dance. Each step must be taken with the budget dollars in mind, and you have to be agile enough to find different funding streams. Although our Title III funds vanished, we were able to purchase Contentdm and other databases from our technology fund allowance, which is managed by the university's IT Department. We are hoping that all of these measures will take us gracefully into the next fiscal year. 🌱
