New approaches for improving design and construction processes have been used recently. Innovative methods for managing the requirements and quality of these processes will be discussed. A systematic data centric approach will be discussed as well as the processes of separating progress from performance. It will discuss the integration of these processes in the planning, risk analysis, design, submission, construction, inspection, quality control and documentation phases.
Three Take Away Points...

1. Analog to Digital
2. Progress VS Performance
3. Requirements Management
1. **Analog to Digital**
2. Progress VS Performance
3. Requirements Management

6
WHY DO WE NEED TO ‘CHANGE’?

Improvements Realized

- Searchable Acceptance Record
- Reduce Misunderstanding
- Better Coordination
- Precision

OWNER
VERIFIER
DESIGNER
BUILDER
1. Analog to Digital
2. Progress VS Performance
3. Requirements Management

HOW DO WE DO THIS?

**Communicate** requirements in a database format as opposed to a ‘novel’ format

**Deliver** the design to the builder as a CADD model and let them figure out the best way to communicate it to their workers.

**Leverage** new technology to build with robotic precision where possible

**Embrace** GPS enabled data collectors instead of hand written forms.
1. Analog to Digital

2. **Progress VS Performance**

3. Requirements Management

In Construction...

---

**PROGRESS**

**PERFORMANCE**

![Graph showing project construction performance rate by major work type]

- Walls: 98.0%
- Utilities: 100.0%
- Roadway: 97.9%
- MOT: 95.0%
- Microtunnel: 98.4%
- Environmental: 91.8%
- Earthwork: 98.9%
- Drainage: 96.0%
- Demo: 100.0%
- Bridges: 98.6%
1. Analog to Digital
2. Progress VS Performance
3. Requirements Management

Why do we collect data on ...

**PROGRESS**
- Claim defense
- Let SR. management know something is happening
- Tell the ‘story’ of the project

**PERFORMANCE**
- Material test results
- Satisfy the FHWA
- Get enough tests to meet frequency guide
Issues with current practice ...

- Should be claim avoidance not defense
- Photos worth a 1000 words
- Boxes of paper don’t always tell the full story
- Majority of issues result of workmanship, not materials
- Frequency of testing not adjusted for past performance
Benefits to be realized ...

- Use trained and qualified inspectors to measure performance of work.
- Use time lapsed cameras to monitor progress of work.
- Fewer inspectors more focused on what they are trained to do – inspect completed work.
- Digital photography can provide a full, time-stamped story of how the work was completed – cheaply.
- Tracking performance can highlight areas performing well and areas under performing.
‘Requirements Management’...
What is it???

“generally conforming to Contract requirements”

“requirement” = clearly communicated parameter
3. Requirements Management

702.10 Pumping Concrete
If the Contractor elects to convey concrete by means of pumping, the concrete shall be handled so as to minimize disturbance to the concrete which significantly alters the properties of the concrete being pumped, especially the loss or variability of the air content. The pumping equipment shall be mechanically sound, suitable in kind, and adequate in capacity for the proposed work. The concrete shall not be pumped through aluminum or aluminum alloy pipe. All pipes used for pumping concrete shall be kept clean and free from coatings of hardened concrete. Pump lines shall not rest directly on epoxy coated reinforcing bars. The pumping equipment shall be located such that operational vibrations will not damage freshly placed concrete.

When placing concrete directly from a truck mounted boom, the concrete pump lines shall have a flexible end section at least 10 ft (3 m) long. Methods of placement shall be such as to result in a steady and continuous discharge. If necessary, this may require the use of a restrictive device at or near the end of the discharge tube, the laying the flexible end section horizontally, or other means. For the initial placement of concrete pours which are predominantly vertical, the discharge end of the flexible end section shall be within 2 ft (0.6 m) of the bottom of the pour.

The Contractor shall submit a description of the pumping procedures which it intends to use, and shall notify the Engineer as to the pumping procedure at least 24 h in advance of concrete placement.

702.11 Cold Weather Concrete
When it is necessary to place concrete at or below an atmospheric temperature of 35°F (2°C), or whenever it is determined that the temperature may fall below 35°F
1. Analog to Digital
2. Progress VS Performance
3. **Requirements Management**

To a Database.
(b) Chutes and Troughs

Concrete shall be placed so as to avoid segregation of the materials and the displacement of the reinforcement. Where steep slopes are required, the chutes shall be equipped with baffle boards or be in short lengths that reverse the direction of movement. Open troughs and chutes shall extend as nearly as possible to the point of deposit. Equipment made of or coated with aluminum alloys shall not be used to transport concrete. Pumping of concrete shall be in accordance with 702.10. When the discharge must be intermittent, a hopper or other device for regulating the discharge shall be provided. Placement of supplementary bins or hoppers may be ordered above the point where concrete is being deposited. The concrete shall be allowed to accumulate in these containers in considerable quantity and shall be discharged immediately through pipes extending from the bottoms of these bins or hoppers. All chutes, troughs, and pipes shall be kept clean and free from coatings of hardened concrete. The water used for flushing shall be discharged clear of the concrete already in place.

Concrete shall not be dropped in the forms a distance of more than 5 ft (1.5 m) except when confined by closed chutes or pipes. Each part of the form shall be filled...
