REPAIR A LEAKING FAUCET

YOUR PROBLEM:
- Leaking faucets waste water.
- Dripping faucet may cause a spot in the sink.
- Constant dripping is annoying.

WHAT YOU NEED
- A box of assorted size washers, unless you know the size.
- A screwdriver
- An adjustable wrench.

HOW-TO
1. First turn off the water at the shut-off valve nearest to the faucet you are going to repair. Then turn on the faucet until the water stops flowing. (Fig. 1)
2. Loosen packing nut with wrench. (Fig. 2) (Most nuts loosen by turning counter-clockwise.) Use the handle to pull out the valve unit. (Fig. 3)
3. Remove the screw holding the old washer at the bottom of the valve unit. (Fig. 4)

4. Put in new washer and replace screw. (Fig. 5)

5. Put valve unit back in faucet. Turn handle to the proper position.

6. Tighten the packing nut. (Fig. 6)

7. Turn on the water at the shut-off valve.

Faucets may look different, but they are all built about the same. Mixing faucets, which are used on sinks, laundry tubs, and bathtubs are actually two separate units with the same spout. You'll need to repair each unit separately. (Fig. 7)

Is water leaking around the packing nut? Try tightening the nut. If it still leaks, remove the handle and loosen the packing nut. If there is a washer under it, replace the washer. If there's no washer, you may need to wrap the spindle with "packing wicking". (Fig. 8) Then replace packing nut and handle, and turn water back on at the shut-off valve.
