to be encoded in the fund name, accessibility of represented meaning is an issue, as well as the creation of a compact code. Mnemonics become important: use sounds that sound/look like what they represent. Thus, Old World History may be clearly encoded OWH, Chemistry becomes CHE and English becomes ELN (so as not to be confused with ENG for Engineering). Limiting the subject-specific coding to the first three characters makes development of codes for the entire subject spectrum straightforward.

Encoding of subject librarian authority for the transaction can be easily done numerically. Small through medium size institutions may find the ten digits 0-9 sufficient to indicate who is responsible for transactions charged against particular fund names. For instance, the Humanities subject librarian may be designated “6” and purchase of a copy of Jane Austen’s *Emma* may be charged against ELN6.

To carry this example on, *Emma* can be bought in a variety of ways. It can be purchased through an approval books plan (A for approval book), as a firm order to replace an older edition that has become worn (D for direct-purchase book), as an audio book for the visually impaired (DA for direct-purchase audio book), as a book in electronic format (DE for direct-purchase eBooks) as a continuation/standing order (STO) as part of the Complete Works of Jane Austen (C for continuation), as a video starring Gwyneth Paltrow (V for video recording), or as streaming video of a dramatic reading from *Emma* (VE for streaming video). The more complete fund name then becomes ELN6A, ELN6D, ELN6DA, ELN6DE, ELN6C, ELN6V, or ELN6VE depending on the item and how the transaction is made.

If this purchase is made from an endowed fund or with grant monies, mnemonic coding may be added to the format suffix and assignment made to a separate ledger. In that way, the Paltrow video of *Emma* purchased with funds from the DeFarge Estate becomes ELN6VDEF.

There is a final issue to be resolved after the fund name schema is worked out to represent the above factors of discipline, librarian, funding source, and format. This concerns the sufficient design of ledgers so that summarization and subtotaling can occur in a fairly convenient manner. In general, one ledger can represent an entire library materials budget or one ledger can be used to represent a separate funding source within the entire materials budget. Since the fund name proper carries ample information, the arrangement of ledger(s) can be thought of as an aesthetic to a certain extent. What a multi-ledger system allows, however, is multi-level subtotalling. A public university library probably has a finite number of funding source types and state-authorized funding object codes. In the state of Kansas, for instance, library materials purchased with state funds are authorized against only two object codes, one for monographs and the other for subscriptions. The funds allocated and charged to these object codes could be handled by two separate ledgers. In addition, all endowment funds could be located in a third ledger, subdivided by donor name, and all grants and cooperative purchases in yet another ledger. Four ledgers are sufficient for our medium-sized academic library and may be sufficient for many larger, more complex libraries.

Within this four-ledger system, some sort of logical organization must be enforced so that ledgers organize similar transactions in predictable ways. Since most administrators prefer fiscal reporting that reflects program support, subdivisions of the ledgers can follow the design of university organization by college and department. Thus, the state-funded Monographs ledger tree could look like this:

A simple, logical, four-ledger accounting tree representing nine colleges and 61 departments results in a printed report of over 1,250 lines. Therefore, spreadsheet sorting can be a real issue. It is highly desirable that a quickly sorted list place major totals and subtotals at the top of the list. Therefore, the fund name for the ledger summary is preceded by a tilde, e.g., ~Summary of Monographs. The fund name for the college is preceded by a "greater than" symbol, e.g., >Liberal Arts & Sciences Humanities. And, names of endowment funds in the Endowment Ledger are preceded by a "less than" symbol (<), with the colleges arrayed under them separately. Using these symbols allows for sorting of grand totals and subtotals at the top of the list and ready access to the allocations and expenditures at any level of the hierarchy.

**Wichita State University Libraries** applied the accounting tree described above to the FY07 material budget allocations. Collection Development and Acquisitions staff worked as a team to develop the hierarchical structure and ledger design, create fund names and codes, prepare spreadsheets of hundreds of specific allocations, and transfer the scheme and fund codes to the Library’s Voyager Acquisitions module. The new fund code system will be well worth the effort as it will allow us to more easily track expenditures by college, discipline/department, funding source, and format.

Changes to acquisitions are driven by major technology shifts — both in productivity technologies and increasingly in electronic library collections. Other driving forces include outsourcing, budgetary constraints and staffing cutbacks, salary levels, and the limitations of library and information science curricula. What are some implications and solutions for acquisitions librarianship?

Shifts in Libraries
Technology-driven Changes

Similar to the overall labor market, acquisitions work has become increasingly interwoven with the online world. Continuous learning of new skills has become crucial in accomplishing increasingly technology-driven work. Skills and workflow needed in today’s acquisitions environment have changed greatly because of new technologies, ever-increasing electronic collections, and consortial subscription agreements. The make-up of positions is changing as a result. Not only are acquisitions librarians tasked with shifting many serials to electronic subscriptions and overseeing database licensing agreements, overseeing these areas is more technology-intense as database accounts and database-coverage analysis tools are managed through vendor extranets and increasingly sophisticated library systems. As managers, acquisitions librarians are also charged with redesigning workflow and re-training co-workers from paper-intensive processing to methods that often are completely new. Computer-savy staff members adapt with relative ease to more and more complex computer environ-
ments, but acquisitions librarians can be faced with designing comprehensive (re)training for those less comfortable with technology. Current job announcements for acquisitions librarians typically call for knowledge of business, acquisitions systems, and software suites, licensing agreements, and vendor relations, knowledge of subject areas as a foundation for collection development, and increasingly complex management and customer-service skills (Chronicle 2006).

Outsourcing

Outsourcing comes in many forms. Shades of outsourcing include approval plans, supply of fiscal data analysis for libraries whose systems lack adequate data analysis capabilities, subscription services, serials-management / coverage analysis systems, cataloging services, and materials shipped shelf-ready. Outsourcing, whether partial or full, is motivated by budgets cuts and staffing cuts paired with the need to maintain existing service levels, new projects added to existing workloads with no corresponding staffing increases, data analysis needs for which in-house tools or expertise are unavailable, or consolidation of several libraries’ business functions. The extent of outsourcing varies by type and size of library, as well as by available expertise. Some geographic regions and prestigious institutions enjoy access to experts in specialized areas of librarianship (Miller 2006). Libraries with less access to such expertise resort to outsourcing business processes to third party vendors in order to concentrate existing staffing on patron services and essential functions best performed in-house (Nuzzo 1999).

Library and Information Science (LIS) Education
Closing and/or Merging of Library Schools.

Reorganization and rationalization, long established in industry, is also felt in academic and public libraries. Similar to businesses forced to cut costs in order to survive, universities and libraries face funding shortages, which drive administrations to consolidate services as cost-cutting measures (Ebersole 2004 and Koenig & Hildreth 2002). Graduate education, while offering flexible programs designed to appeal to working professionals, finds itself in a scenario of small programs merged with larger ones. In Library and Information Science, merged programs vary by size, autonomy, and companion discipline. Fewer stand-alone library schools mean less practically oriented coursework and more coursework devoted to the philosophical tenets of information, technology, and education.

The Skill Gap between LIS Education and Practice

Library and Information Science curricula focus on philosophical and historic foundations, reference, computers, and technological developments. Real-world
job preparation in practical fields such as acquisitions is generally left to
improptu learning on the job (Giles 2002, Gorman 2006). Skills needed
for success in acquisitions librarianship include knowledge of business, account-
ing, automation, library systems, vendor relations, customer service, and
management. Rather than learning these areas in library school, librarians
often learn them on the job and at workshops, or bring them from
prior paraprofessional experience or previous career fields.

Recruiting and Placement
Skilled Acquisitions Librarians: Why and where are they going?

Acquisitions job lists abound, as
evidenced by a search in Websites of
library associations and library journals,
professional listservs, and the Chronicle
of Higher Education. Advertised posi-
tions often reflect increasing emphasis
on electronic materials: positions for
electronic resource and serials librarians
comprise over half of listed positions
examined. While electronic resources
management is often a separate position,
in lean times or in small libraries these
duties are combined with the acquisi-
tions librarian’s overall duties. Often the
work entails managing print acquisitions
plus overseeing major technology and
workflow redesigns. Acquisitions posi-
tions also reflect increasingly blurring
lines between acquisitions and collec-
tion development, thus often marrying
“the mechanics of purchasing” with the
intellectual tenets of collection develop-
ment and management.

What do hiring libraries look for?
Stated requirements include knowledge
of several areas or functions: business
practices, software suites including
spreadsheets and database programs,
and library systems, in addition to
the business of acquisitions. Preferred
knowledge and experience include
management, leadership (especially
in large, complex, and/or multi-site
organizations), accounting, vendor rela-
tions, negotiating license agreements,
knowledge of scholarly publishing
methods and trends, proficiency in other
languages, understanding of interna-
tional and specialized material sources,
supervisory and organizational skills,
complex problem-solving and deci-
sion-making skills, and a track record
of professional development and service.

Many positions suffer from small
candidate pools and reopened searches.
Newly minted librarians interested in
acquisitions rarely have the desired
continued on page 69
experience and skills listed in job ads, due to a shortage of acquisitions course work (Giles 2002). Many qualified professionals are deter-
ted by lower status (Desmarais 2002), dis-

tenchanted with the general lack of upward
career paths (Miller 2002), and low salaries
especially in light of the skills required (Shaw
librarians are also scared off by tenure
requirements (Miller 2002). Excessive tenure-related
bureaucratic procedures unrelieved by a support system can drive
away newcomers (Olson 2006). Thus, some librarians with well-rounded
business and acquisitions skills opt to work for database
companies, book and serial vendors, automation
vendors, research-centered companies, or
in emerging non-traditional information-centered
careers such as corporate knowledge
managers and chief information officers (LIS
job type 2006). Future shortages loom ever
larger in light of the graying library profession: it
is anticipated that 68% of librarians now
working will retire by 2017 (Lenzini 2002).

Where will Future Acquisitions Librarians
come from?

Ironically, although some newly minted
library school graduates may opt to remain
in their paraprofessional positions to avoid
pay cuts that can come with beginning
professional positions, there are paraprofessionals
already working in libraries who decide to
move to the professional level and grow their
careers (David 2004). Just as experienced
librarians may opt for the commercial side
of acquisitions and information management,
some people working for vendors may fall
in love with librarianship through the back door
by working with librarians and decide to join
our ranks (Kugel 2005). Equally ironically,
personnel coming from other professions bring
practical skills that can be transferred into the
library setting.

How can we replenish the ranks of librarians? Strategies include “grow your own”
initiatives focused on supporting full-time
library employees’ pursuit of library degrees,
mentoring library-degree-seeking paraprofessionals through transitions to professional
positions, programs pairing library pages with
volunteer mentors, weekend and distance
programs geared toward working professionals
(Lenzini 2002), and recruitment of scholars
from other disciplines, to bring multilingual
scholars into academic libraries (Career
Opportunities 2006). At Winthrop University,
the library has supported several staff members
who went to library school and then took
professional positions; several of the library’s
students went on to library school and
became librarians.

LIS education is focused more on education
than training; librarians do need a theoretical
foundation to provide meaningful context to the
practical work areas. Library schools
should give equal exposure to all areas of
library work. What are some possible hybrids
between theoretical education and practical
 acquisitions training? Solutions could include
MBA-style class projects designed to tackle
real-world challenges. Other possibilities:
practitioners serving as real-world guest lecturers in
LIS programs (on-site if practicable, or through
distance programs), library-hosted acquisitions
internships built into library degree programs,
and library-hosted acquisitions internships for
undergraduate students considering library careers.
Winthrop University has participated in
all three of these teaching approaches.

Once new acquisitions librarians are in
place, how will we keep them? As more
librarians enter the profession from diverse
backgrounds and non-conventional paths, they
bring beneficial skills, creativity, and
perspectives. These newcomers also bring fewer preconceived
notions of “how we’ve always run libraries”. Valuing
their contributions will help keep them motivated
(Neal 2006). In academia, overloading junior
librarians with excessive service burdens will result in driving
them away (Olson 2006). Mentoring and
support for professional development help
accelerate new acquisitions librarians to the
organization, their area of expertise, and
the interrelating of acquisitions work with other
library functions, the world of vendors and
libraries’ constituencies.

Outsourcing and the Future Face of
Acquisitions

As more libraries face bottom-line mandates
to cut costs, assessing the cost-effectiveness of
acquisitions and technical services operations
is more crucial than ever. Business skills are
integral to making cost-benefit comparisons
between in-house work and outsourcing time-
consuming steps such as satellite-tapping, comput-
er skills and technology expertise are important
elements in achieving efficiency in materials
processing and sharing library information.
For example, computer programs that extract
interactive Web-based lists of new acquisitions,
with title-specific hotlinks to the online catalog
are more cost-effective and timely to produce
in-house than if outsourced to a system vendor,
especially if such lists are updated frequently and
the acquisitions librarians know how to do
the database programming.

Boundaries between business, cost analysis,
research technology, acquisitions, and
collection management are blurring. Knowledge of
all these areas will equip tomorrow’s acquisitions
librarian to select appropriately from
available vendor and technological support.
Strategic approaches will help avoid obso-

teness that could result from outsourcing
business processes more efficiently performed
in-house (Nuzzo 1999).

Major changes in libraries, LIS education,
and career paths toward librarianship are alter-
ing the face of acquisitions. Proactive librarians
will have an important role in elevating the
variety and status of acquisitions work, thus
attracting highly skilled persons to the field.

continued on page 70
While researching something else I ran across an item in a business journal that caught my eye. For those of you born on or after 1980, let me add that this is called serendipity in research. It’s something that cannot be done in the electronic medium, and one of the many things we’ll lose when all the world is digital. Now I know all the GenXers with hover parents will look askance and wonder why the anachronism but let me ignore them and go on. Serendipity is a coined word by Horace Walpole (I use as my authority the fabulous ‘Brewers Dictionary of Phrase and Fable’, not the one online, but the 1870 edition that’s damnably difficult to find anywhere anymore.) Walpole first used it to describe lucky and unexpected “finds” by accident. As he described it in a letter to his friend Mann in 1754, he based the word on a fable called ‘The Three Princes of Serendip’ because the princess were always making discoveries by accident and sagacity of things they were not in quest of.” Serendipity is the ancient name for Ceylon. 

One cannot do this now, or cannot do it well now, because so much is going digital. In the old days, when I was a boy, one hunkered down in a library and while working, did a good bit of browsing. I found many things on the way to the original quest, most of which one did not use right then, but made a note of it, literally, and used it later, most probably on an entirely different research project. Penicillin was discovered in this manner, along with many other things we now take for granted. With all things digital, the only serendipity one may hope to find must be in what text one had “up” at the time.

Anyway, while looking for this other thing, I ran across a notice where Google had purchased a thing called YouTube.com for over a billion dollars. It caught my eye because I thought I knew all about YouTube and could not for the life of me think why in the world anyone, even Google, would want to buy YouTube for a dollar, much less for almost two billion of them. Sure enough, there in the business journal was the purchase in October 2006. YouTube will remain independent but owned by Google. But, I said to myself, wasn’t YouTube that site of various stupid clips, the best of which had been pulled for copyright and various other reasons? 

So, off I went to YouTube. What could possibly be the attraction? Perhaps there were millions of things I had missed, or otherwise omitted in my original research. Perhaps I had looked at Google’s videos before they bought YouTube, and so now YouTube would improve the silly clips on Google.

Once there, I recognized the site instantly and found myself in something of a predicament. Google is, after all, the very site that is going to put us all out of work eventually if it hasn’t already. I knew from prior research that young people use Google far more often than they use library Websites and even all those very expensive proprietary databases we librarians beat ourselves up over trying to secure to the tune of millions of dollars. In fact, college-age students use Google about three or four times more often than they use library Websites. It leads to the obvious question of why we librarians spend so much time and effort trying to secure them if students are only going to ignore them, but let’s take this for the time being. Let’s leave, too, the obvious quandary why our own professional organizations, like ALA, complain that we’re not making our library searches engines more like Google and so on. In any event, I want to be fair so I must give YouTube every opportunity to succeed even if I don’t want it to.

I began delving into YouTube once again. By examining YouTube’s top ten, its top 100, and its random categories I figured I would see its best, and so be able to judge it on its own merits. First on the list was a header which read “young woman with large hooters.” This was followed by a young man setting his bums on fire as he tried to light his own flatulence, an enormous number of “jackass” stunts (appropriately named), and about a dozen or more clips from various television programs, some of which I could view and others I could not because of my hardware. Since I didn’t view the young woman I have no idea if her described attributes were her only “meritorious” ones, or whether she could also sing or dance as well. Perhaps she belonged to Mensa? Still, reading the first 100 descriptions, I wondered why in the world one of them would cistram anyone from their daily labors. To say that the emperor, as personified in this YouTube, hasn’t any clothes is to state both the factual and the metaphorical. Not only is the emperor naked, but also are the duke, the duchess, the prince and the pauper. Why would anyone go back to such a site?

As for the young man, well, there was one frame and sure enough he had a lighter and was poised for something. I did not view it either but I figured I had to dig deeper so I looked for more, sifting through nearly all “Top 100” as determined, I suppose, the way everything on the Web is determined to have value: for no other reason than many come to view it. Based on these merits alone — what makes people stop and gawk — every train wreck and every three-legged dog are more important than Shakespeare. Let’s hear it for the self-absorbed and the unreflective. I can only hope the young man is suffering from third degree burns.

I did view a school principal, a white man, who was trying to rap. I suppose he did it to help children learn, though I do not know for sure why any educator, real or imagined, thinks this works. I can only guess that like principals who spend the night on top of an elementary school or cut their ties it is, patently, to encourage children to learn. It makes sense, right? Do something stupid and children will jump at the chance to stay in school. What one has to do with the other is anyone’s guess. I grew up in that antediluvian age when
